

Repatriation is a method, *not a decision.*

The reason cloud repatriations fail is rarely the technology. It is that they are attempted as one decision, executed as one project, and abandoned in the middle with two platforms running and nobody able to say whether it is going well.

This book is 122 Moves. Each is one job with a stated cutover, a stated risk and a rollback that has been thought about. Each can be done on a Tuesday and undone on a Wednesday, and you can stop after any of them and still be somewhere coherent. Three of them tell you to keep paying somebody else.

Every Move covers all three clouds: it names the real service on AWS, Google Cloud and Azure, and the one thing that is different on each.

122 Moves	5 Parts
110 at zero downtime	13 you cannot undo
3 clouds, every Move	1 closes the account

The whole book is open source. Every Move, and the software that typesets them into this book, is published under an open licence at github.com/OneUptime/back-to-metal. Correct it, extend it, add the services your own estate runs. Infrastructure knowledge this practical should not sit behind a consulting invoice.

BACK TO METAL

Leaving the cloud with Kubernetes.

BY THE MAKERS OF ONEUPTIME

One Move, one job, one stated cutover.
A rollback that has been rehearsed.
And three Moves that say keep paying somebody else.

122	5	110	3
MOVES	PARTS	AT ZERO DOWNTIME	SAY KEEP PAYING

12 OF THE 122 · MINUTES OF DOWNTIME

The estate nobody sizes	0	The verification gate	0
The bill of materials	0	CDN: change vendor, not model	0
Who can get in at 03:00	0	The 03:00 disk	0
The first rack	0	The rota	0
The etcd restore drill	0	What it actually costs	0
Builds onto your own metal	0	The last account	0
